Revolutionary Green Floor Care Solution

Superior Results

- Deep cleans Grouting + Carpets
- Unique Technology
- Fast, Safe Action
- Visual Excellence

Cost Saving

- Long Lasting Results
- Increased Life Span of Carpets
- High Concentration Formulations
- Best In-Use Costs
- Time Saving

Enviro Certified

- Products are proudly endorsed by Indalo Yethu, SA's official environmental campaign
- Internationally certified by Eu Ecolabel & Canadian Environmental Choice
- Manufactured in South Africa

Clean Deeper, Reach the Impossible With a Green Solution

First impressions last, whether you are a staff member or a visitor to a facility. The floor space in a building is a predominant feature and contributes greatly to the overall look and feel, which will influence ones overall impression of a business. It could also influence a decision whether or not people want to work, live or do business in that building. Cleaning and maintenance of floor spaces, hard or soft, is therefore vital.

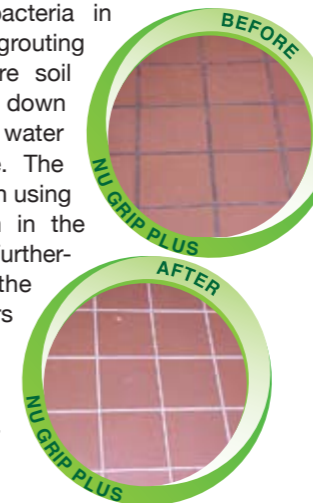

The Cleaning Wheel- In the cleaning process of floor spaces, a facility manager needs to carefully consider the cleaning wheel and the costs thereof. When one of the elements is reduced in the wheel, one or more of the remaining elements must be increased in order to achieve the same level of cleaning.

This is where working with live beneficial bacteria cleaners comes into a class of its own! As soon as the solution comes into contact with the floor surface, the fermentation extract and live bacteria starts the cleaning process immediately and continues cleaning long after the cleaning operator has gone. This shifts the cleaning wheel, decreasing some of the segments, resulting in various benefits for all.

Innu-Science products can equip you with this innovative way of cleaning. Allowing the live beneficial bacteria cleaners to go deeper, removing tough dirt, that is impossible to reach with conventional chemicals, achieving superior results in a shorter period of time.

Hard Floors- Over time stubborn dirt collects in floor grouting, resulting in an often labour-intensive cleaning programme. By using either **nu grip plus** or **nu action 3**, you can reduce the intensity of labour and time. The live beneficial bacteria in these products penetrate the grouting and the small spaces where soil accumulates, breaking these down into carbon dioxide and water making it easier to remove. The superior cleaning results when using **nu grip plus** can be seen in the before and after photos. Furthermore, the bio-film created by the beneficial bacteria renders the hard floor slip-resistant thus, reducing accidental slips and falls, giving the property owner a greater peace of mind.

Simple Choice- When selecting an Innu-Science floor care product consider the following:

nu action 3	Synthetic fats, oils and grease (FOG)	Parking garages, workshops, etc.
nu grip plus	Organic fats, oils and grease (FOG)	Food production and kitchens
nu karpet kare	Carpets, furniture, upholstery, etc	All stains and malodours (pet, etc)

Proper floor care is demanding and in most settings, it consumes more time and labour. It is estimated that floor care costs can take up as much as 80% of the cleaning budget, with as much as 90% of the costs attributed to labour. It is therefore important that the facility manager considers and evaluates every element in the cleaning wheel.

Cleaning Agents from Innu-Science proposes a new spin on the wheel. This new green floor care technology, keeps floors well maintained with fantastic results. Using Innu-Science's innovative technology enables you to care for the environment that surrounds you, both indoors and outdoors. In turn, this will help you now make a lasting, clean impression on all who pass through your facility, daily.

Local Production- Our Innu-Science SA operation produces our products in Centurion in a Medical Control Council Accredited Production facility. Due to the fact that we are formulating with live beneficial bacteria and biological fermentation extracts, our products cannot be produced in a conventional hard chemistry factory, hence our decision to make use of clean room processes to ensure optimum conditions.

Carpets- A 1000 people will track in up to 1.6 Kilo's of dirt into a building on a rainy day. This additional soil load is difficult to remove once walked into the fibers of the carpet, embedding and compacting itself deep into the carpet pile. By using **nu karpet kare** in Innu-Science's Spray & Vac programme (spray carpets & vacuum on alternative days), the live beneficial bacteria cleans deeply breaking down and lifting the accumulated dirt from the carpet pile, allowing the colour of the fibre to return to its original state. Many of our customers will testify that after using the Spray & Vac method for a period of time they experience *carpet pile rejuvenation*.

Apart from delivering superior cleaning results **nu karpet kare** also eliminates malodours and extends the carpet life-cycle. **nu karpet kare** has further demonstrated its capability, when used in smoking areas. The established beneficial bacteria flora continues to eliminate the heavy lingering odours that get captured in furnishings and carpets, keeping the soft surfaces clean and free of cigarette smoke odours.

Products for Floor Care:

nu grip plus
hard floor cleaning
– organic soils

nu action 3
hard floor cleaning
– synthetic soils

nu karpetkare
carpet maintenance
& stain remover
